Rings

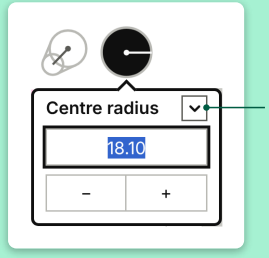

Every mark, number and track on a dial is a ring.
A ring repeats one kind of thing round the centre.

What a ring is. One row in the list, drawn at one radius. Tracks, hour marks, numbers, bezels and zones of colour are all rings; this diver has eleven.

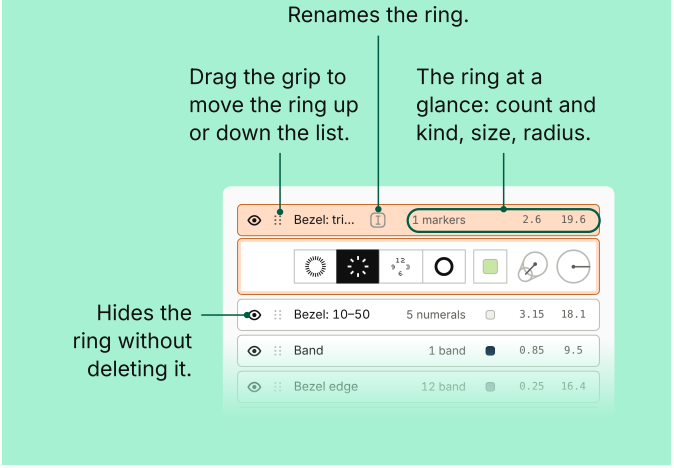

⚠ **Watch.** A ring's radius runs from the centre to the outer edge of ticks, markers and bands, and to a numeral's anchor: its middle, its baseline or its top.

Four kinds. Ticks are lines, as on a minute track. Markers are heavier shapes, usually for the hours. Numerals are numbers or words. A band is flat colour, whole or in pieces. A ring can change to another kind at any time, and it keeps all of its settings when it does.

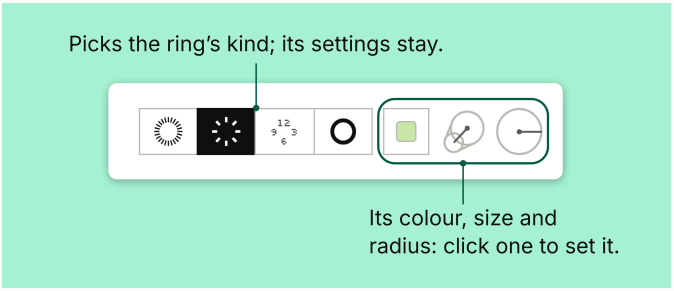

Sets a numeral's anchor: centre, baseline or top.

Adding and arranging. A new ring or a copy goes in above the selected ring and becomes the selected one. A new numerals ring takes its type from the numerals already on the dial. Duplicate is the quick way to a second track: copy one, then change its radius.

Stacking order. The list is the stacking order: the top ring is drawn last, over the ones below it. Hide a ring to see what it covers.

⚠ **Watch.** A ring gives way only to rings above it, so moving it can bring marks back or take them away. Hidden, a ring is neither drawn nor exported, and no ring gives way to it.

The ring drawer. It opens under the selected ring's row. Click a value button to type a number, or press it and drag: right or up raises the value, and Shift makes each step finer.
